

ChemtrailsGeelong.com: Rainwater Sample Collection Tips

Above: Collection vessel should be situated in a clear space

Above left and right: A funnel helps to keep the sample free of larger contaminants

\* Wash container and funnel, then rinse thoroughly with demineralised water, and drain/dry before deployment. Apply this also to any containers you transfer the sample to for transport. A larger funnel/surface area of collection vessel aperture will enable you to collect water more quickly. Use metal free components in all cases, including lids.
